

ANMS 2021 Spring

Méthodes Numériques Avancées et Simulation Advanced Numerical Methods and Simulation

Objectives

The course covers several numerical methods to solve time-dependent Partial Differential Equations using adaptive stabilized finite elements. Advanced methods for turbulence modelling, multiphase flows, complex fluid flows, and aerothermal modelling of complex systems will be introduced.

Finally, the course will be completed by *a posteriori* error estimation techniques needed for anisotropic parallel mesh adaptation.

Lecturers

Elie Hachem
Aurélien Larcher
Youssef Mesri
Thierry Coupez
Jeremie Bec
Rudy Valette
Philippe Meliga
Franck Pigeonneau
Jonathan Viquerat
Patrice Laure

Course content

1. Numerical methods
 - Parallel computing and HPC
 - Convection Diffusion Reaction : stabilized finite elements
 - Navier-Stokes : variational multiscale approaches
 - Mesh adaptation
 - Error estimators and anisotropic remeshing
2. Modelling and simulation
 - Turbulence modelling
 - Two-fluid flows
 - Newtonian and Non-Newtonian Fluids
 - Flow control and optimization
 - Deep Reinforced Learning for Fluid Mechanics

Schedule

30h Courses + Exercises

Week 03

12. January	I/E102
14. January	I/E102

Week 04

19. January	I/E102
21. January	I/E102

Week 05

26. January	I/E102
28. January	I/E102

Week 06

02. February	I/E102
04. February	I/E102

Evaluation

The course is evaluated based on the results obtained during numerical simulation labs and a final written examination covering the theoretical arguments developed during the lectures :

Lab exercises	25%
Examination	75%
